## **Windsor Overhead Crane Safety Training**

Windsor Overhead Crane Safety Training - Overhead crane safety training equips operators with skills and knowledge about crane safety measures, materials handling, accident avoidance, and equipment and stock protection. Trainees would learn the types of overhead cranes, their capabilities and their uses in different industry settings. For operators who are trained and licensed, the shift in liability moves to the operator from the company. Hence, the program emphasizes individual operator responsibilities.

The operators in the overhead safety training course will receive instruction about the right methods for carrying out inspections: the more detailed in-depth inspection and the pre-shift inspection. These are vital daily routines which should be logged. Properly recorded pre-shift inspections help to protect the business from liability in the event of an accident. Pre-shift checks likewise prevent damage, costly repairs and accidents. Operators learn how to designate a specific person to handle inspections, how to report problems, and how to maintain the log book.

Every check must be documented and carried out regularly. Things that must be inspected for possible concerns, include: increase in the throat opening, hooks for cracks, hoist ropes for corrosion, degree of twist, worn wires, loss of diameter, kinks and bird caging, broken wires, chains for nicks and gouges, chemical and heat damage, twists, cracks and corrosion, distortion, excessive wear, pits, stretching, damage caused by extreme heat.

Operators learn proper rigging procedures in this course. Rigging includes understanding the manufacturer's data plate, determining the material weight to be lifted, choosing the gear, and using safe practices to secure the load. The program cover in detail the following: safe working loads, and the capacities of ropes, chains, hooks, shackles and slings.

It is vital to know who can operate the cranes at your facility, physical requirements of the job, and operator qualifications required for specialized tasks and permits. Safety must be prioritized when operating near pedestrian traffic.

The duties involved in the safe crane operation consists of checking for hydraulic leaks, undertaking visual inspections, testing the controls, checking the safety guards, examining the hoist rope and hook, limit switches and braking mechanisms. Right reporting methods are vital. These topics are all covered in depth in the program.

Proper lifting and moving procedures with hoists and cranes are covered in the course. Operators will become competent in hand signals. Training includes how to raise the load, attach the load, unhook the slings, abort a lift and set the load.

Moving the load involves several steps: starting and stopping procedures, controlling and guiding the load, working with signals and observing working conditions. Operators must know how to proceed in case of a power failure. The course covers methods for lowering the load and removing the slings, parking the crane, storage equipment, and securing an outdoor and indoor crane.
